

BUSINESS CLOUD PRINTING

From the cloud to the right printer. No manual hand-offs.

Connects business software to local print queues — documents reach authorised workstations, print on the exact queue, and return a verifiable PRINTED or FAILED result. The printer stays local; control stays central.

Exact routing

Queues configured by site, printer, tray or paper format — delivery notes, labels and invoices land right.

Duplicate protection

Atomic job claims — two clients never process the same document.

Automatic recovery

Retries after temporary failures; resumes after network interruptions.

Security model

Per-device MFA authorization, OS-native credential stores, short-lived tokens, tenant isolation.

No inbound doors

Outbound HTTPS only — no open ports, no exposed print servers, no VPN for printing.

Platforms

Windows x64 (signed MSI), macOS Apple Silicon/Intel, Linux DEB + portable — Java 17 bundled.

Four steps, one closed loop

01

App creates PDF

Names the destination queue.

02

Gateway protects

Tenant-isolated, authorised only.

03

Client claims

Prints to the exact local queue.

04

Result returns

PRINTED or FAILED — provable.

Close the last metre.

Pilot it on one workstation and one printer — and watch the first verifiable PRINTED come back.
